

FAAST LT Upgrade Program

July 2020

Thousands of FAAST aspirating smoke detectors (ASD) installed worldwide have been operating continuously over the past decade. While many older ASD detectors continue to operate reliably, service and/or failure may occur more frequently as a result of system degradation; sometimes leading to total detector replacement. This may be particularly prevalent in applications where detectors are operating in dirty or dust-filled environments or have not been appropriately maintained. A failure typically results in unscheduled maintenance visits often translating to premium repair/ replacement charges for the customer or increased cost to the service provider.

As an incentive to our FAAST LT customers, we are offering up to 10% discount on the purchase of any loop or standalone FAAST LT-200 detectors in replacement of the legacy FAAST LT range.

This upgrade program is effective from 27th July to 31st December, 2020.

FAAST LT is a leading ASD range with a large installed base, particularly in Class C applications where standard sensitivity smoke detection is required. FAAST LT-200 represents the next evolution in this technology; offering improved smoke detection performance, flow monitoring and flexibility in application.

FAAST LT-200 offers the following improvements:

- High sensitivity IR-LED detection chamber provides higher sensitivity, whilst minimizing nuisance alarms
- Improved airflow monitoring (i.e. extended flow tolerance range of $\pm 50\%$)
- Pre-alarm setting for added flexibility
- 3-stage external filter for enhanced performance in harsh environments
- Improved position of air inlets, outlets and switches for easier installation/maintenance

To benefit from the program, please contact your local sales representative.
